

Flooding in Hong Kong has been the most talked about problem brought by climate change in recent years. In reality, it is and has been the most urgent problem that needs to be solved in recent years. Sudden rainstorms, overwhelmed drainage systems and flooding streets are affecting the society in each and every corner. What moved me was the fact that climate change is one of the leading causes of flooding, therefore a story about people struggling under huge floodings in Hong Kong would strike the hearts of people in Hong Kong.

The class discussions helped me understand that climate change is not only about carbon emissions, but about systems, inequality, and preparedness. Flooding in Hong Kong shows all three. A dense city built on highly engineered land depends on infrastructure that must keep pace with heavier rainfall and rising sea levels. But when drainage, coastal planning, land use, and emergency response are treated separately, the whole system becomes fragile. Systems thinking makes it clear that one weak point can trigger larger failures. A blocked drain, a saturated slope, or a flooded underpass is not just a local inconvenience, it is evidence that urban life is connected to climate risk in deep and structural ways.

The story I think best presents the solution is not one of fear, but of collective responsibility. The most effective way to move people is to show that flood resilience is not just a technical issue for engineers or planners, but a shared civic project. People respond when they can see themselves inside the problem and inside the solution. In Hong Kong, that means framing flooding as something that touches all citizens in Hong Kong, or even the world. A flooded neighborhood is not only damaged infrastructure, it also is lost of access, increased stress, and vulnerability. When people understand that, climate awareness becomes personal.

With that, a story with the greatest impact could be structured. First, we could start with how heavy rainfall affected Hong Kong in recent years, for example flooded streets, malls and lobbies, or landslides causing traffic in some mountain areas. This catches the attention of the watchers by using some real life examples and spark interest among them.

Following that, a brief background of how climate change contributed to the increased rainfall in Hong Kong, shifting the focus from just flooding in Hong Kong, to a global threat, climate change. Throughout the years, discussions about climate change are one of the biggest topics in the world, yet it did not affect Hong Kong as much as other countries and cities. However, the increasing number of black rain signals and flooded streets definitely caught the eyes of Hong Kong citizens. This would be a good opportunity to promote climate change understanding and state that we are one of the causes of the heavier rainfall year by year in Hong Kong.

Lastly, the story can end with what us as citizens could do to help the world. Some small acts like using less air conditioners and choosing public transport over using cars or some bigger acts like supporting sustainable businesses or engaging in political advocacy could help with climate change. The message that I wish to deliver to watchers is that although we are tiny compared to the Earth, when everyone does these small acts, it brings a huge impact to the problem.

With the structure in mind, the story can be narrated. It can start with a student that has to go to school like normal weekdays, but when they leave home for school, they encounter the heaviest rainfall in Hong Kong. Flooded streets, clogged drains can be seen everywhere, pictures and videos of the disasters can be shown. Then when they got the notice of not needing to go to school, the formation of the heavy rainfall and how it is caused by climate change can be reported by news reporters on the tv. Lastly, the solution and what we can do to help with climate change can be spoken by a narrator in the background, with the students doing the act for a clearer picture.

In conclusion, people are most easily moved by real life incidents and facts with datas, so for a story, putting images and videos of disasters could easily grab the attention of watchers. Therefore combining these events and some information with data could definitely move watchers and promote climate change to the public.
